

Thank you again!!!

As you say that splitting the span at the deepest point of stiffener curvature, i don't sure the span  $L$  is chosen  $L1$  or  $L2$ . because if  $L1$ , so long that the section modulus would also be required very large. but i see photos of boat (i.e. azimuth yacht), the stiffener dimension is not large, so i feel very confused ,How solves this problem, please help me.
