

Mark out the three main hull panels using the dimensions given and the cutting sheet as a guide  
Note, there is very little waste, so cut the panels carefully along the lines you draw.

Use the other ply sheet as a straight edge  
and also to draw right angles.  
Draw the hull bottom centreline  
340mm from one edge  
Mark the 400 spacings at right angles  
to the long ply side.  
Use a ball point pen or pencil (I used a felt pen  
so the lines were clearer in the photos)

Marked CL (detail)

Start at the transom and work forward  
(the last measurement is more than 400  
and will depend on your actual sheet length)  
You will need to adjust the panel joint position  
if it is not 8ft (2500mm is a common size)  
Carefully mark the distances up/down the line  
to give the panel width each side of the CL  
Again, use the other ply sheet as a set square

Use in conjunction with building sheet 1
